

Christopher Farrugia

Backend / Full-Stack Software Developer

Go, TypeScript, Linux, Microservices & IoT Systems

Summary

Backend / Full-Stack Software Developer with nearly 4 years of professional experience building backend services, web applications, and IoT-connected systems for live production environments. My work is primarily backend-focused, with strong full-stack experience across Go, TypeScript/Node.js, Vue.js, Laravel, PostgreSQL/MySQL, Redis, RabbitMQ, Docker, and Linux.

I've led multiple IoT integrations and developed scalable, real-time platforms that support connected devices, telemetry pipelines, and operational workflows. I'm particularly interested in backend architecture, messaging systems, microservices, and event-driven applications built with Go and TypeScript.

Experience

Lead Software Developer • IoT Solutions Malta

September 2022 — Present

- Lead Software Developer and, for the first two and a half years, the sole developer working on the company's IoT and fleet-management platform, covering system design, backend services, microservices, frontend integration, and Linux-based infrastructure.
- Built real-time data pipelines for connected devices including **Teltonika** trackers, custom parking sensors, level sensors, and in-house **IoT Pro sensors devices**.
- Developed Linux-based parsers to receive **TCP/UDP** payloads, decode telemetry, and route structured data through **RabbitMQ** and **Kafka**, with Redis used for caching and synchronisation.
- Delivered cloud integration for the in-house IoTPro sensor line, covering temperature, humidity, pressure, radar, and generator sensors, including **FOTA updates**, uplinks/downlinks, and integrations with ThingsBoard and the company's tracking platform via REST APIs, RabbitMQ, and Kafka.
- Managed **Linux servers**, **Docker deployments**, SSL configuration, and system monitoring to help keep production systems reliable, scalable, and secure.
- Contributed to external projects including UI extensions for the **Malta Gaming Authority** by integrating with an existing database and expanding the existing system, and building a **Laravel dashboard for Marine Hound** to visualise harbour-emission data.

Selected Project

iotrack.live — Full-Stack Fleet & IoT Platform <https://iotrack.live>

Personal project focused on real-time fleet tracking, telemetry, and microservice-based IoT architecture. Built with Vue, TypeScript, Go, Node.js, PostgreSQL, Redis, RabbitMQ, Docker, and Linux. Includes live maps, dashboards, auto reporting, and real-time service communication. Designed around device telemetry pipelines, messaging, and scalable backend services for connected assets and IoT integrations.

Skills

Programming Languages

JavaScript, TypeScript, PHP, Golang, HLML, SASS & CSS

Libraries & Frameworks

Vue JS, React, Laravel, Node JS, Tailwind, Bootstrap

Database Management

MySQL, PostgreSQL, MongoDB, Redis

DevOps & Tools

Linux & Bash, Docker, Apache, RabbitMQ, Kafka, Git & GitHub

Certifications

MQF Level 5

'VET Award for Development with MySQL and PHP'

Zend Certified Engineer

PHP 7.1 ZEND033155

LPIC-1 Linux Administrator

lpi.org/v/LPI000519379/fpjbv2febd3

Languages

English speak, read, write

Maltese speak, read, write

Italian speak

Interests

Distance Running: Regular participant in local and international half-marathons.

Chess: Passionate about strategy and continuous improvement through online study and practice.

Volunteer Work: Served with St John Ambulance (2012–2020),

Personal Interests: Learning, photography, & painting.
